## Quality, Innovation, Competitive Price

Welch Materials is a multinational company that develops and manufactures chromatography consumables including HPLC column, Solid Phase Extraction (SPE) column, GC column, Prep column, Flash column and packing materials.

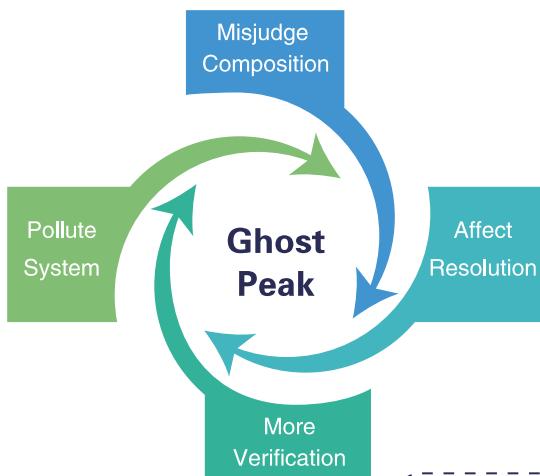

Welch Materials (Shanghai), Inc. was established in 2003 at Shanghai, China and Welch Materials (Zhejiang) was set in 2011 at Jinhua, Zhejiang, China. We also have set Welch Materials, Inc. at Hurst and Welch Materials India Pvt. Ltd. at Gurgaon. Our initial strength was our extensive experience on particle surface modification science and techniques. We are experts on bonding chemistry and innovative packing materials for chromatography applications. Through the optimal utilization of our resources, we have developed many innovative LC and GC consumable products, in particular, our five series HPLC columns, Ultisil™, Welchrom®, Xtimate®, Topsil® and Boltimate™.

# Ghost-Buster Column

## What is Ghost Peak?

The peak appears erratically like ghost in chromatographic separation, especially during gradient elution or long-period operation.

## Where is Ghost Peak from?

- Water, with impurities
- Purification System, polluted or poorly functioning
- Storage Containers, polluted or breeding bacteria
- Mobile Phase Additives, like salts, acids and alkalis
- Instrument, polluted after long-period use
- Other organic pollutants

Welch Ghost-Buster Column can effectively remove impurities with low polarity and thus prevents the interference from all kinds of ghost peaks. It is installed between gradient mixer and injector, which helps remove not only the impurities in mobile phase, but impurities in mixer and pipelines as well.

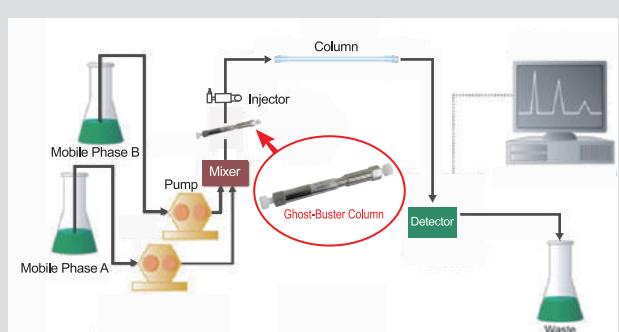

## ○ Operation Principles

Unlike in-line filters which removes only solid particles but not organic pollutants, Welch Ghost-Buster column provides strong adsorption to weak-polar and non-polar organic impurities, without changing the composition of mobile phase, thus to purify both mobile phase and system, remove most ghost peaks and extend lifetime of column and system.

## ○ Precautions

1. Install the column between Mixer and Injector. Being installed after injector would cause strong adsorption to samples and affect analysis.
2. For new analytical columns, flush Ghost-Buster column with 80% methanol solution at 1 mL/min for 20 min before new column switching to the system.
3. Not all impurities can be adsorbed by Ghost-Buster column.
4. Ion-pair solvents in mobile phase, would be adsorbed by Ghost-Buster column and affect retention and peak shape. Please use with caution under such mobile phases.
5. Column lifetime depends on analytical conditions, mobile phase and solvent purity. Routine change of Ghost-Buster column is suggested to ensure performance.
6. Ghost-Buster column is rather a purification part to the system, to filtrate impurities and protect column and system.
7. Before and after using buffer salt mobile phase, flush column with high-ratio water to transit, thus to avoid buffer salting out and blocking the column.
8. When Ghost-Buster column shows unsatisfying performance, try disconnect the outlet of the column and flush with 100% acetonitrile.

**Install the Ghost-Buster column between Mixer and Injector. Sample solution must not flow through the column.**

## ○ Q&A

**Q: For different samples and gradient conditions, should the Ghost-Buster column be removed or changed?**

A: Not necessary. But it needs to be removed only for special circumstances like changing of peak position or ion-pair solvents mobile phase.

**Q: When gradient elution changed to isocratic, should the Ghost-Buster column be removed?**

A: No need to take the Ghost-Buster column if it did not affect the separation, as the elution of mobile phase stays same under isocratic condition. But impurities in mobile phase shall be taken into consideration.

**Q: In gradient system, Ghost-Buster column increases the mixed dwell volume. Will this affect the separation?**

A: The packing volume of a 4.6×50mm column is ~400 µL and the column is installed before the injector, which would cause little influence on the analysis. If it does, connect Ghost-Buster column to the water phase path before the mixer or switching valve.

**Q: Any requirements for the connecting of Ghost-Buster column?**

A: No special requirements for the connection. Common PEEK tube and connectors for HPLC system is recommended, as metal connectors may have the possibility of being stuck at column ends.

# Ultisil™ Series HPLC Column

Ultisil™ Series HPLC Columns are based on ultra-pure ( purity > 99.999% ) spherical and totally porous silica, unique bonding chemistry and proprietary surface modification techniques, producing excellent peak shape, column efficiency and exceptional lot-to-lot reproducibility. Ultisil™ column is the best choice for method development, owing to complete bonding chemistries and stable performance.

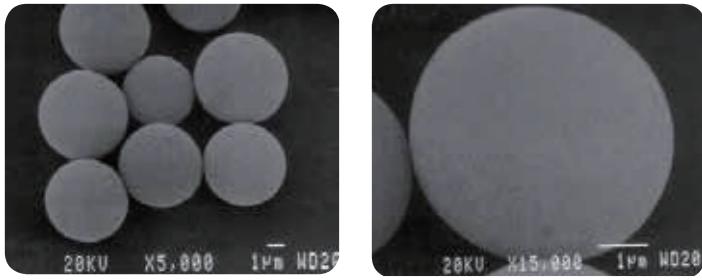

## Features:

- Ultra-pure spherical porous silica, purity > 99.999%
- Unique bonding chemistry and endcapping technology
- High efficiency: theoretical plate > 80000/m
- Excellent peak symmetry: tailing factor=0.95~1.05
- Wide pH range: 1.5-10
- Long column lifetime
- Exceptional lot-to-lot reproducibility
- Complete bonding chemistries with different selectivities

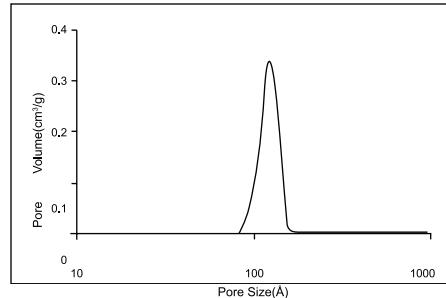

## Ultisil™ HPLC Column Packing Materials

Pictures below show size uniformity and surface smoothness of the packing particles, characteristics that enable more uniform packing with less channeling effect, resulting in lower back pressure and higher column efficiency.

## Trace Amount Metal Contents Test

A useful chromatographic test of trace amount of metal contents in the column is to compare the peak symmetry of one pair of positional isomers, 4,4'-dipyridyl and 2,2'-dipyridyl, and a neutral chelating reagent, 1,2-dihydroxylnaphthalene. 4,4'-dipyridyl, which cannot form chelating complex with metal, is used as a reference. 2,2'-dipyridyl and 1,2-dihydroxylnaphthalene, which are chelating reagents, are sensitive to trace amount metal in silica. When a C18 column based on type A silica or other so-called type B silica with higher metal content is used, the peaks of 2,2'-dipyridyl and 1,2-dihydroxylnaphthalene would tail or even totally disappear.

Column:	Ultisil™ XB-C18, 4.6 × 150 mm, 5 µm
Mobile Phase:	20 mM phosphate(pH 7.6) / methanol=55/45
Flow rate:	1.0 mL/min
Detector:	215 nm
Temperature:	25°C
Injection Volume:	1 µL
Samples:	1) 4,4'-Dipyridyl 2) 2,2'-Dipyridyl 3) 1,2-Dihydroxylnaphthalene

Ultisil™ XB-C18 provides good peak shapes in the separation of these three compounds under pH 7.6, which indicates Ultisil silica contains hardly any metals.

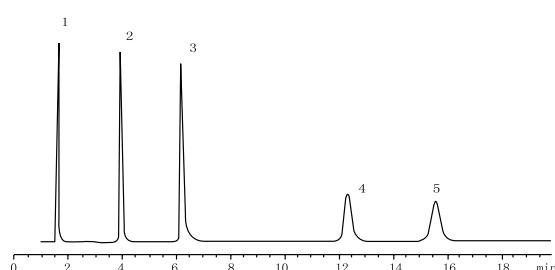

# Ultisil™ XB-C18—Universal HPLC Analytical Column

Ultisil™ XB-C18 is the most commonly used column in the market. It can substitute Waters Symmetry C18, Agilent Zorbax XDB C18, Phenomenex Luna C18, Supelcosil LC-18-DB, YMC ODS-AM, Alltima C18, GL, Inertsil ODS-2 etc. XB-C18 has high theoretical plates and peak capacity, so it's suitable for analysis of complex samples.

# Ultisil™ XB-C8--Less retentive than XB-C18

The XB-C8 phase is less retentive than XB-C18 phase, useful for strong hydrophobic compounds that are too strongly retained on C18 phase, and for LC/MS applications, where long retention is not desired. When separating neutral or other highly retained compounds, XB-C8 can save analytical time. However, when separating polar compounds, XB-C8 column provides different selectivity than does XB-C18 column.

# Ultisil™ XB-Phenyl--Different Selectivity to Alkyl Phase

Ultisil™ XB-Phenyl phase is less retentive than conventional C18 or C8 phases, but more retentive than standard cyano phase. Due to their ability to participate in  $\pi-\pi$  interactions, XB-Phenyl columns may actually be more retentive than C18 or C8 columns towards certain polar aromatic compounds, depending on running conditions. The selectivity for highly polar aromatics, which are poorly retained on alkyl-bonded phases, together with reduced retentivity towards non-polar compounds, make XB-Phenyl an excellent choice for the analysis of complex mixtures of polar and non-polar analytes. Additionally, this bonding phase boasts high surface coverage and exhaustive double end-capping, leading to better performance.

# Ultisil™ XB-CN--unique selectivity for polar compounds

Ultisil™ XB-CN column can be used in either reversed or normal phase. Reversed phase CN column has special selectivity for polar compounds, and due to its low hydrophobicity, elution of hydrophobic molecules is fast. Furthermore, XB-CN column shows perfect peak shape for strong basic analytes (including quaternary ammonium salts). Polarity of XB-CN column is the strongest among all reversed columns. It is a good choice for compounds that are strongly retained on standard reversed columns.

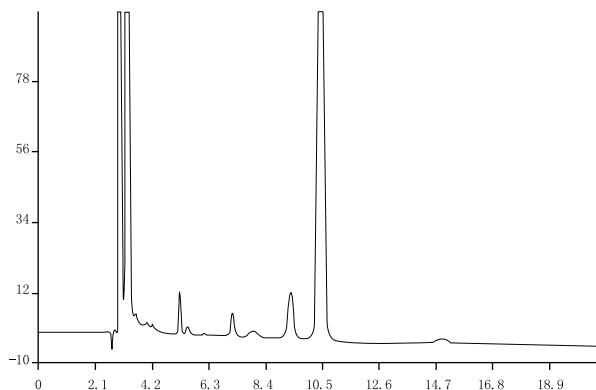

Normal phase CN column can replace SiO<sub>2</sub> column. Equilibrium of normal phase column is fast, and the silica surface activity is better than that of silica column. To prolong column life time, alternation between reversed phase and normal phase uses should be avoided. While XB-CN column can be used in either reversed or normal phase, elution sequence is different in different separation mode.

- Can be used in either reversed or normal phases
- Stable bonding chemistry and excellent surface coverage
- Low hydrophobicity, unique selectivity

## Ultisil™ SiO<sub>2</sub>

Ultisil SiO<sub>2</sub> column uses ultra-high purity type B silica particles with no metal contents. SiO<sub>2</sub> column can separate strong hydrophilic compounds in high concentration organic solvent in reversed phase. Good result can be obtained for the analysis of polar compounds which are prone to peak tailing in reversed phase.

## Ultisil™ Diol

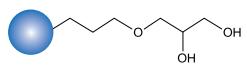

Ultisil™ Diol Column is based on ultra-pure porous spherical silica bonded with 1,2-dihydroxypropyl functional group silica. Ultisil™ Diol is used in normal phase mostly, suitable for separation of peptides, proteins, polar molecules, and organic acids and its polymers.

Like bare silica, Ultisil™ Diol has the ability to form hydrogen bonds and is capable of separating structure isomers. Since most of its surface is covered with organic functions, Ultisil™ Diol absorbs less water, which leads to more reproducible activity. It is also the sorbent of choice when working in normal phase in the presence of water. It has a different selectivity than bare silica gel, and slight modification in the composition of solvent mixture may be necessary to obtain a similar retention.

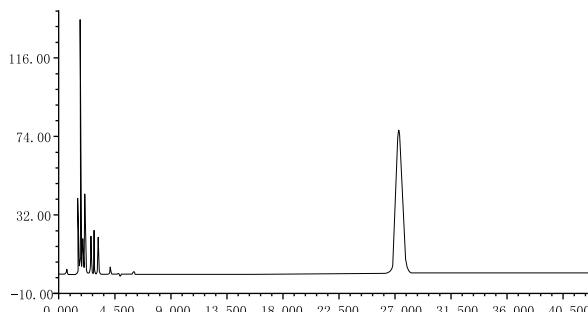

Ultisil™ Diol column is more stable than traditional normal phase columns, such as NH<sub>2</sub>, SiO<sub>2</sub>. Compared with NH<sub>2</sub>/SiO<sub>2</sub> column, Diol column is not sensitive to water. Ultisil™ Diol column can also be used in reversed phase analysis.

- More stable than traditional normal phase columns, such as Silica, Amine
- Can be used in reversed phase analysis
- Similar polarity to Amine
- Good selectivity without excessive retention
- Improved peak shape compared to bare silica

# Ultisil™ XB-NH<sub>2</sub>

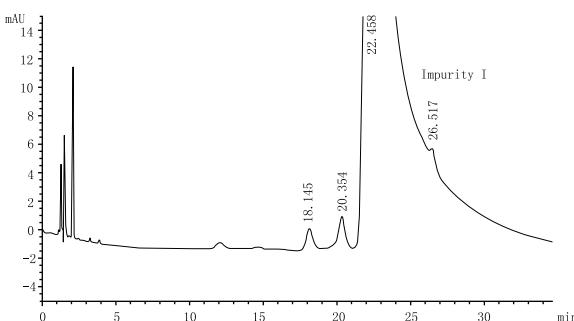

Ultisil™ XB-NH<sub>2</sub> column is based on propyl-amino silane, mostly used in normal phase, but can also be used in reversed phase.

- Used in normal phase for weak anion-exchange, and in reversed-phase HPLC for polar compounds
- For applications in aggressive normal phase mode with aqueous eluent
- Vitamins A and D can be separated in the normal-phase mode
- Carbohydrates and sugars can be separated in the reversed-phase mode

# Ultisil™ Ion Exchange Column (XB-SAX&XB-SCX)

Ultisil™ ion exchange columns are available for both Strong Anion Exchange (SAX) and Strong Cation Exchange (SCX) columns. The SCX/SAX columns are silica based with high resolution and high efficiency.

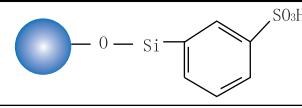

Ultisil™ SAX is a polar bonded phase, consisting of an ammonium-functionalized silane, while Ultisil™ SCX is a classical strong cation exchange, consisting of a covalently bonded aromatic sulfonic acid moiety.

- Organic modifiers such as acetonitrile and methanol may be used with SAX and SCX columns, within organic/buffer solubility constraints
- Retention can be controlled by varying pH, ionic strength and organic modifier content.

# Ultisil™ XB-C30

Carotenoids is a broad class of natural products, of which over 600 types have been found so far, including compounds of different carbon chain length, such as C40, C50 and C30 etc. They are well known to have many biological functions, including cancer prevention and treatment functions.

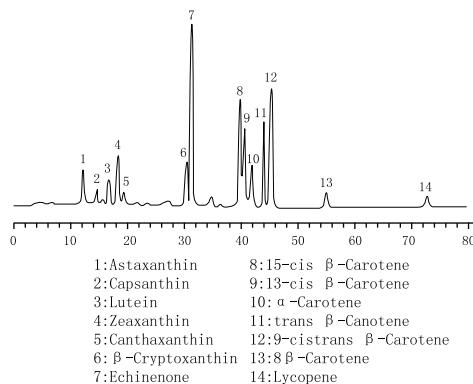

Compared to classical C18 stationary phases, the C30 phase is much more hydrophobic and retaining. Even when pure organic eluent is applied, many sample solutes, such as carotenoids, are able to retain. Ultisil™ C30 is designed for the separation of geometric isomers, polar carotenes, polar and nonpolar xanthophylls, steroids, retinols and fat-soluble vitamins (A, D, K and E).

- Polymeric C30 alkyl chains
- Very lipophilic
- Exceptional selectivity pattern for geometric isomers

# Ultisil™ AQ-C18

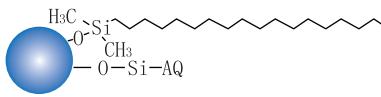

## --The most widely used column in food industry

Ultisil™ AQ-C18 columns are designed to have extended retention and selectivity for hydrophilic and polar compounds, which are poorly or not at all retained on other phases. A proprietary bonding chemistry, Ultisil™ AQ-C18 avoids so-called "phase collapse", even when 100% water is used, a phenomenon that conventional C18 columns typically exhibit at high water content in the mobile phase. Ultisil™ AQ-C18 phase is fully end-capped to ensure the best peak shapes of polar and basic compounds and longer lifetime. Typical applications are separations of water soluble compounds that cannot be retained on traditional C18 phase. Examples include biomolecules, metabolites, and pharmaceutical degradants such as organic acids, water-soluble vitamins, oligosaccharides, amino acids, and small peptides and nucleotides.

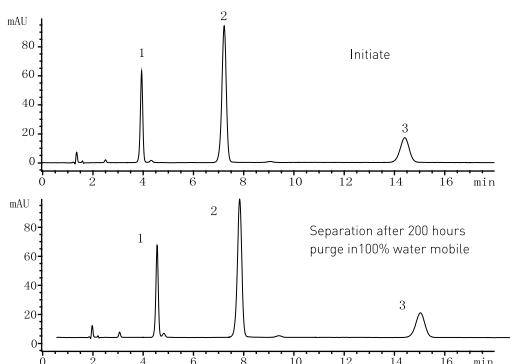

### Features:

- No phase collapse, suitable for high aqueous mobile phase
- Less retentive than XB-C18 for non-polar compounds
- Increased retention for polar and water-soluble compounds

### Ultisil™ AQ-C18

Structural Formula	
pH Range	1.5-10.0
Particle Size	3 µm, 5 µm, 10 µm
Surface Area(m <sup>2</sup> /g)	320(120 Å)
Carbon Loading(%)	12(120 Å)

### Phase collapse research

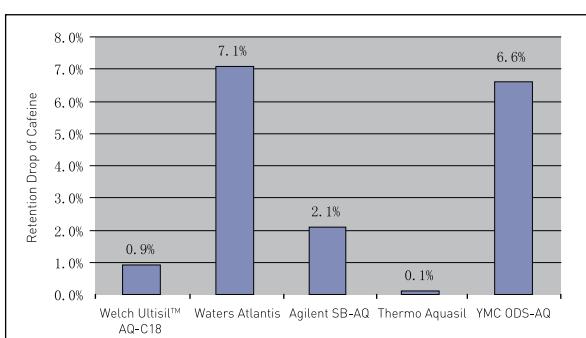

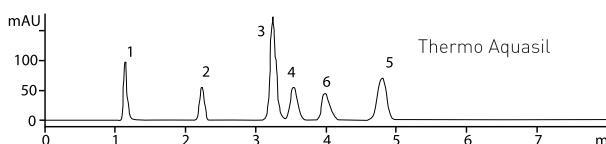

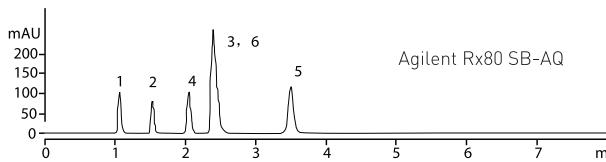

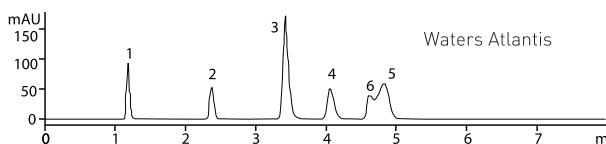

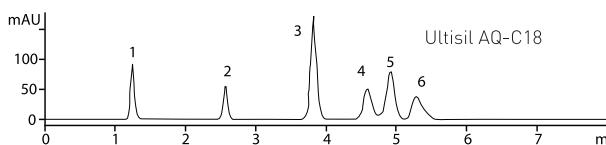

Column:	Ultisil™ AQ-C18, 4.6 ×100 mm, 5 µm
Mobile Phase:	Acetonitrile/50 mM phosphate(pH 3.5)=10/90
Detector:	215nm
Temperature:	25°C
Flow Rate:	1.0 mL/min
Samples:	1.Theophylline 2.Caffeine 3.Phenol

### Phase Collapse Comparison with Other Brands

Peak shape is excellent for acid, basic and neutral samples on AQ-C18. When in highly aqueous mobile phase, retention for polar compounds such as organic acids, peptides, nucleosides and water soluble vitamins is strong.

Under the same condition, when compared with other brands in highly aqueous mobile phase, Ultisil™ AQ-C18 shows excellent resistance to phase collapse.

<b>Column:</b>	Ultisil™ AQ-C18, 4.6 ×100 mm, 5 µm

### How to choose XB-C18 and AQ-C18?

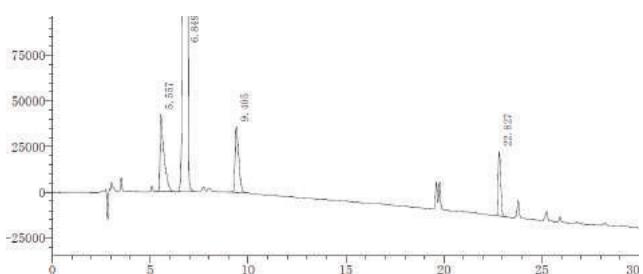

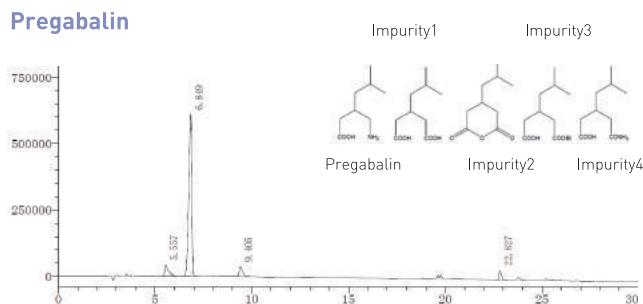

#### XB-C18

- Suitable for separation of most pharmaceuticals, environment and chemical compounds
- Excellent peak shape for basic and polar samples

#### AQ-C18

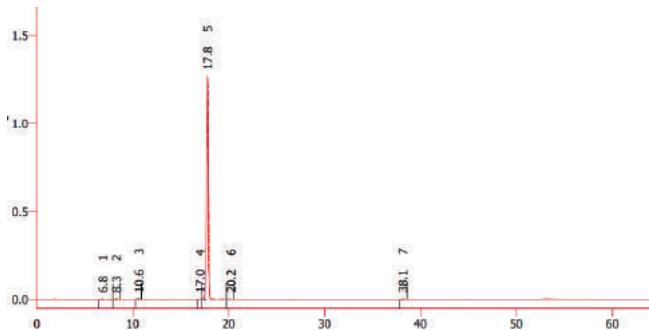

- Suitable for water soluble strong polar samples, such as traditional Chinese medicine ingredients, food, beverage, organic acids, peptides, nucleosides and water solution vitamins
- Best choice for mobile phase that contains <20% organic content

# Ultisil™ LP Series HPLC Column

LP is abbreviation for **Low pH**. LP phases are designed for use at low pH conditions. LP phase consists of two very bulky hydrophobic protective groups to prevent siloxane bond from hydrolysis at low pH condition. So Ultisil™ LP column is extremely stable in very low pH mobile phase and at high temperature, even at the lowest pH of 1.0, making it the most stable phase for low pH application in the market. Because it is not endcapped and has more surface silanols, LP phase has more retention for some early eluted polar compounds, and provides different selectivities . Ultisil™ LP-C18 is the most polar C18 among all the C18 products of Welch.

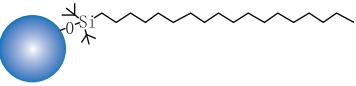

- Not endcapped, prevents siloxane bond from hydrolysis at low pH condition.
- Compatible with 100% water as the mobile phase, more polar than “AQ”, better peak shape and resolution
- Best peak shape for polar compounds
- Exceptional lifetime at low pH (0.5-8.0) and high temperature

## How to choose XB-C18 and LP-C18

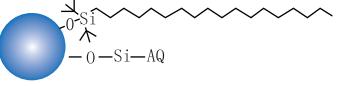

When pH<5.0, based on your separation conditions, you may choose either LP-C18 or XB-C18;

When pH<2.0 (such as 0.1%TFA), LP-C18, which provides exceptional stability, longer lifetime, perfect peak shape and superior selectivity, is your best choice

# Ultisil™ ALK-C18

Ultisil™ ALK-C18 is a new generation of C18 column introduced by Welch. In this column, hydrophilic groups are bonded into the silica surface, where large number of silanol groups are replaced, reducing the interactions between basic samples and the silanol groups. As a consequence, the selectivity of ALK-C18 is different from that of traditional C18.

Features:

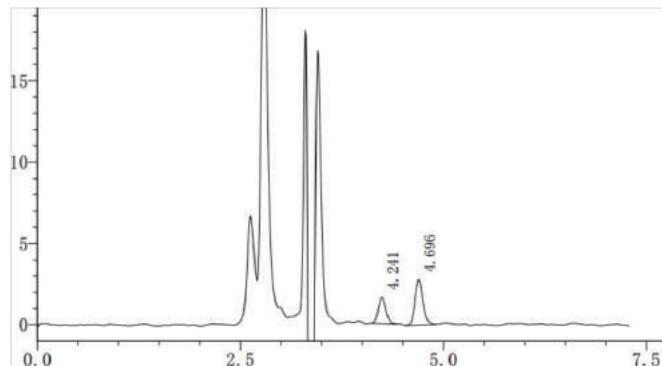

- Mixed solid phase with both hydrophobic and electrostatic interactions
- Excellent peak shape for basic compounds
- Fast separation of similar samples on a column

# Ultisil™ ODS-3

## -- High Water-resistance Octadecyl HPLC Column

Ultisil™ ODS-3 column is packed with high water-resistance octadecyl reversed-phase packing material. The hydrophilic end group of the octadecyl functional group is strictly endcapped, which brings perfect peaks and low adsorption for both alkaline and acid compounds. The 100% water-resistance packing material avoids the collapse of stationary phase and applies to the separation and determination of most compounds.

- 100% water resistance
- High efficiency and resolution
- High sample loading
- Easy preparative magnifying
- Different selectivity from common C18

# Ultisil™ XS-C18

Ultisil™ XS-C18 is developed with high column efficiency, high loading and high capacity. It has excellent steric hindrance selectivity, especially shape selectivity.

There are two patterns of Steric Hindrance: Steric Exclusion and Shape Selectivity. Ultisil™ XS-C18 uses unique multi-bonding technique, with high bonding density and short distance between ligands, providing better shape selectivity.

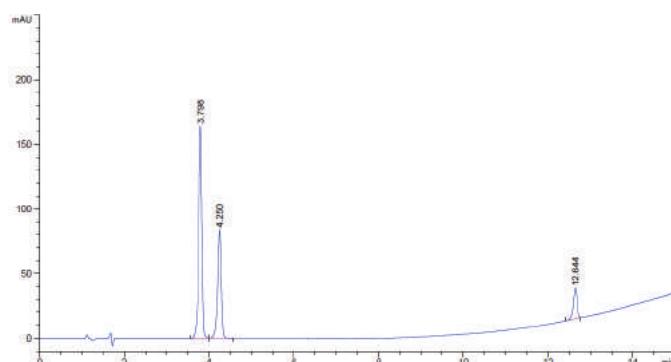

## Minimum cross- Section of Solute

Compound i has more narrow size, with smaller cross-sectional area, which allows it go into the ligands and provides better retention; Compound j has wider size, with bigger cross-sectional area, which makes it rejected out by stationary phase, providing shorter retention time. Thus are two compounds separated. Normal bonded columns have bigger interstices between ligands, which allows both compounds through and results in poor resolution.

# Ultisil™ PAH

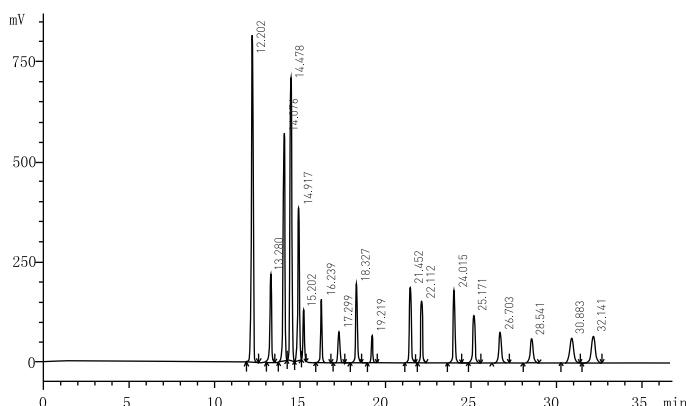

Ultisil™ PAH Column is a special column recently designed by Welch for the separation of PAHs in EPA method 610. PAHs (Polycyclic Aromatic Hydrocarbon) are hydrocarbons with two or more benzene rings, and considered major pollutants. Therefore, the analysis of these potentially carcinogenic compounds in water, air, soil and food takes high priority. Most of PAHs do not exist alone. Substances that may contain PAHs include charcoal, crude oil, creosote, tar, drugs, dyes, plastic, rubber, pesticide, lube, release agent, electrolyte, mineral oil, pitch, insecticide, and bactericide, etc.

## Ultisil™ PAH

Particle Size	3 µm, 5 µm
Surface Area(m <sup>2</sup> /g)	320(120 Å)
Carbon Loading(%)	22(120 Å)
USP List	L1

Ultisil™ PAH columns can separate all 18 PAHs in EPA method 610 rapidly with high resolution. Ultisil™ PAH columns are silica based columns for PAH analysis with the best peak shape.

# Ultisil™ Polar Embedded HPLC Column (polar-RP&Phenyl-Ether)

Ultisil™ polar embedded phases have been developed for more than 10 years. Earlier polar embedded phase is developed with amide phase. The polar functional group close to the surface increases the wet ability of this phase, thus decreasing phase collapse, making this phase compatible with mobile phase of up to 95% water content. The polar functional group also shields the effects of unreacted silanol groups, providing excellent peak shape for very polar and strong basic compounds and different selectivity than C18 phase. Welch provides two kinds of packing materials - Ultisil™ Polar-RP and Ultisil™ Phenyl-Ether.

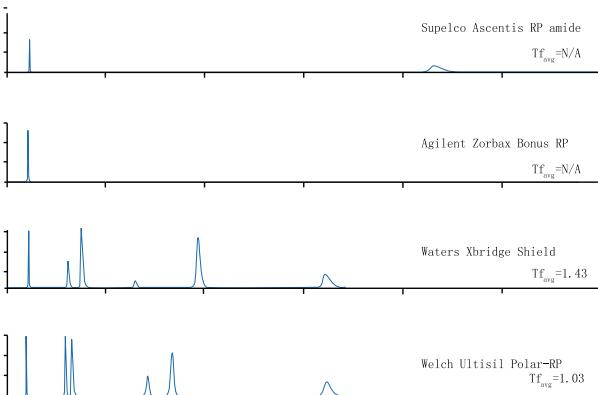

## Ultisil™ Polar-RP

Structural Formula	
pH Range	1.5-10.0

Surface Area(m <sup>2</sup> /g)	320(120 Å)
Carbon Loading(%)	18(120 Å)
USP List	L1
Endcapped	Yes

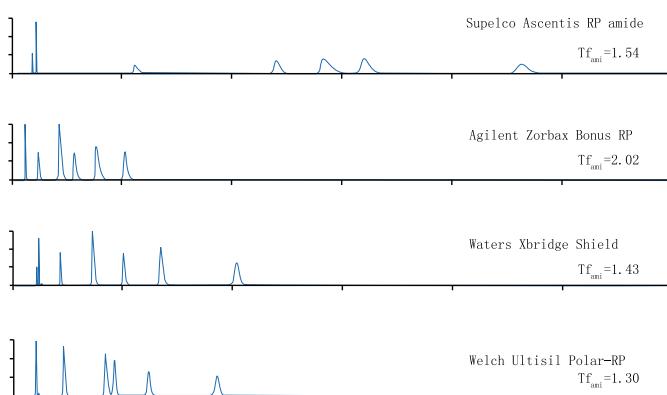

## Ultisil™ Polar-RP HPLC Column

- Excellent at 100% water content in mobile phase, even better than AQ-C18
- Different selectivity to AQ-C18
- Excellent peak shape for acidic and basic compounds owing to the “shield” effect of polar linkage to silanol activity by forming hydrogen bonding
- Be retentive for polar compounds. Uracil, which can't be retained on most reversed phase columns at 100% water, can be retained on this column, and eluted after 5-fluorocytosine and cytosine. Analysis of purine, pyrimidine, small molecular acids, catecholamine and water soluble vitamins, requires high water phase content mobile phase
- Fast separation of similar samples on a column

# Ultisil™ Fluorinated Phase(PFP&F-C8)

Ultisil™ Fluorinated Phase has high selectivity and increased retention toward closely related compounds, including both aromatic fluorinated compounds and other nonaromatic halogenated compounds. It can be used in reversed phase and provides an alternative and complementary separation to that performed on C8 or C18 columns for many analytes. Fluorinated phase has better separation for ionic and polar compounds than do alkyl phases. Fluorinated phase can provide different elution orders, leading to enhanced selectivity for compounds that are difficult to separate.

## Ultisil™ PFP

## Ultisil™ PFP

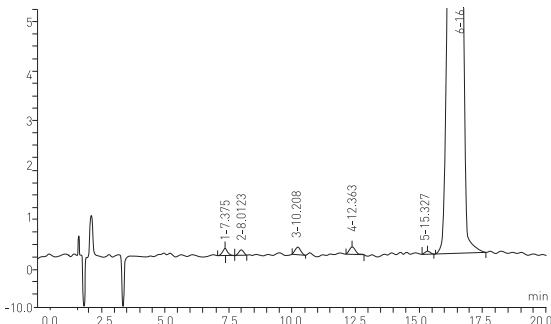

Ultisil™ PF-Phenyl is a phase primarily used in the separation of molecules bearing fluorine atoms, but may also be in the separation of non-fluorinated compounds such as Taxol and its derivatives. Because of its phenyl ring, it has a higher selectivity for aromatic molecules than for other alkyl-fluorinated phases. Ultisil™ PF-Phenyl can separate nitro-benzene isomers (para vs. ortho), which cannot be separated by conventional phenyl phase.

## Ultisil™ HILIC-NH<sub>2</sub>

Structural Formula	
pH Range	2.0-8.0
Particle Size	3 µm, 5 µm, 10 µm
Surface Area(m <sup>2</sup> /g)	320(120 Å)
Carbon Loading(%)	4(120 Å)
USP List	L8
Endcapped	No

Column:	Ultisil™ HILIC Silica, 4.6 ×250 mm, 5 µm
Mobile Phase:	Acetonitrile/0.01mol/L ammonium acetate =65/35
Flow Rate:	1.0 mL/min
Detector:	215 nm
Temperature:	Ambient
Injection Volume:	20 µL
Samples:	Glutamine, chloropropylamine glutamine, dipeptiven

Column:	Ultisil™ HILIC-NH <sub>2</sub> , 4.6 ×250 mm, 5µm
Mobile Phase:	Acetonitrile/0.05 mol/L KH <sub>2</sub> PO <sub>4</sub> (adjust pH 4.0 with H <sub>3</sub> PO <sub>4</sub> ) =65/35
Flow Rate:	0.7 mL/min
Detector:	215 nm
Temperature:	30°C
Injection Volume:	20 µL
Note:	Use the mobile phase to fully activate the column before testing the sample on the column

# Ultisil™ HILIC Amide

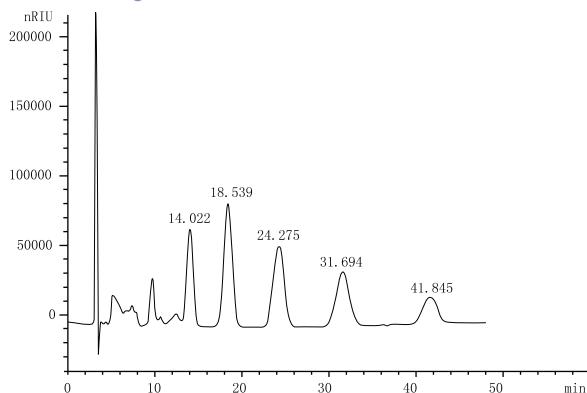

Ultisil™ HILIC Amide column is a special column designed for HILIC mode. As amide group has strong hydrophilicity, stability and electrically neutral, Ultisil™ Amide has longer life, better separation repeatability and peak shape than NH<sub>2</sub> phase does.

- Based on silica bonded with amide groups, appropriate for the separation of hydrophilic samples
- Multiple actions such as hydrogen bond, molecular and electrostatic interactions
- Good compatibility with many kinds of detectors, such as MS detector
- Stable in organic mobile phase that contains water

# Ultisil™ HILIC Amphion II

Ultisil™ HILIC Amphion II is a newly developed HILIC column, using amphion-bonded silica as packing material. It applies to the separation of most polar compounds, using acetonitrile or Water other than ion-pairing reagents as mobile phase. The Amphion, containing both Positive Charge Centre and Negative Charge Centre, brings high retention for acid and alkaline compounds through ion-exchange mechanism. Compared with common HILIC packing materials like silica and amino groups, the Amphion-bonded packing material provides better reproducibility and stability.

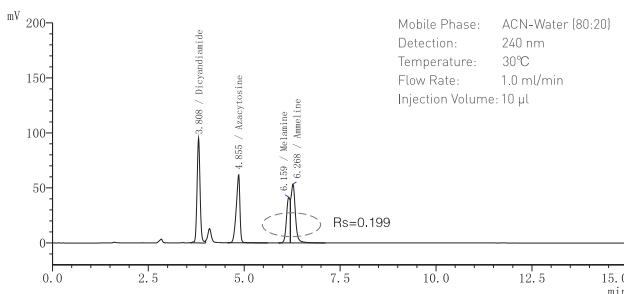

- Amphion-bonded silica stationary phase
- Enhanced hydrophilic interaction brings higher retention for polar and hydrophilic compounds
- Different selectivity from common HILIC packing materials
- Simple mobile phase used for the separation of polar compounds

Before use, flush with 50 column volumes of mobile phase (acetonitrile/water, 80:20) to equilibrate. Before injection, flush with 20 column volumes of mobile phase to equilibrate. For gradient analysis, flush with 10 column volumes of original mobile phase between injections.

Note:

- 1) Shifts of retention time may occur, if not sufficiently equilibrated.
- 2) Acetonitrile is the most common mobile phase solvent in HILIC mode. Other water-soluble polar organic solvents can also be used as mobile phases. The comparison of elution strength is: THF < Acetone < Acetonitrile < Isopropanol < Ethanol < Methanol < Water.
- 3) Long-period equilibration required, after using buffer salt mobile phase (like ammonium formate, ammonium acetate etc.) and buffer salt being flushed off.
- 4) After use, flush off the buffer salt in the column and store in 100% acetonitrile solvent.

# Ultisil™ Amino Acid HPLC Column

Ultisil™ Amino Acid HPLC columns are made from spherical, totally porous, and ultra-high purity (>99.999%) type B silica particles. Our proprietary surface modification before bonding generates a very smooth and uniform surface with less acidic surface silanol. Ultisil™ Amino Acid columns provide the best performance in peak shape, efficiency and resolution for the analysis of 18 amino acids. Complete sample preparation can be achieved in as little as 30 min.

# Xtimate® Series HPLC Column

---Next generation beyond mid-range priced Ultisil™ series

X features of Xtimate® column

eXtra pH range: wide pH range from 1.0 to 12.5, excellent peak shape for strong bases

eXtra column lifetime: 5 times of similar product such as Gemini

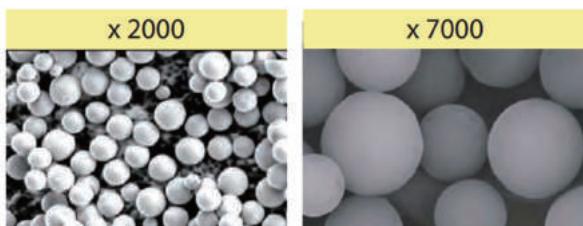

eXtra performance: column efficiency of 5μm columns is as high as 90000/m, 2-3 times of that of Xterra

eXtra care from Welch: enjoy excellent pre-sales and after-sales service from Welch

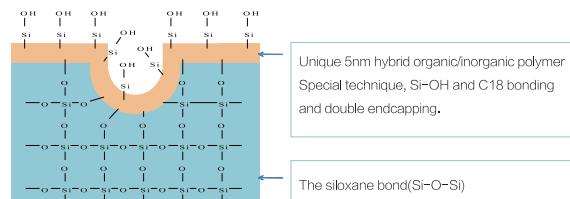

## Xtimate® Silica Based HPLC Column

Xtimate® HPLC column derives its outstanding performance from a special hybrid particle based technique, which coats a unique 5nm organic/inorganic polymer layer on the silica surface, so that the pH range is extended to 1.0-12.5.

Xtimate® column is designed for HPLC method development. Regardless of the types of mobile phase or high temperature, Xtimate® HPLC column always has stable performance and long lifetime.

### Comparison of Peak Shape After Soaking In Base

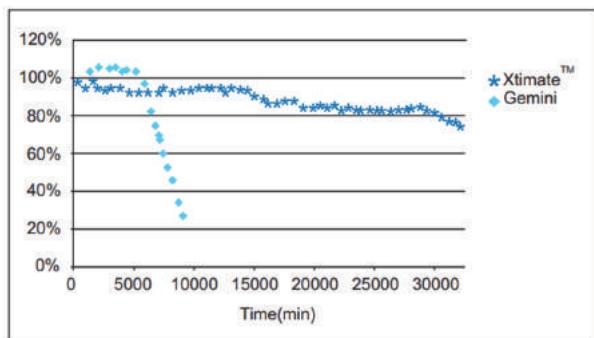

Column:	Xtimate® C18, 5 μm, 150 x 4.6 mm
Mobile Phase:	CH <sub>3</sub> CN/0.01N-NaOHaq.(pH=12)=30/70
Flow Rate:	1.0ml/min
Temperature:	40°C
Soak Time:	4 hours

Column:	Ultisil™ C18, 5 μm, 150 x 4.6 mm
Mobile Phase:	CH <sub>3</sub> OH/H <sub>2</sub> O=60/40
Flow Rate:	1.0 mL/min
Temperature:	40°C
Detector:	UV 254nm
Samples:	1.Uracil      2.Methyl benzoate 3.Toluence    4.Naphthalene

After test at pH 12 condition for 4h, the peak shape of hybrid particles based Xtimate® column shows no difference.

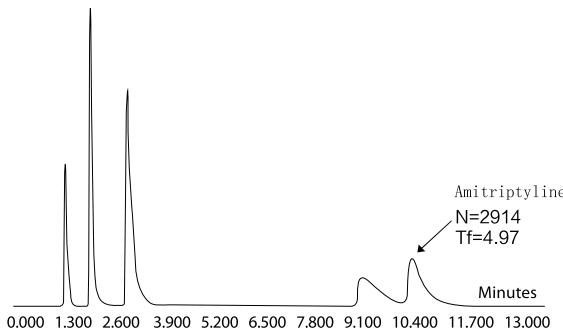

### Lifetime Test Comparison: 5 Times Longer Than Gemini

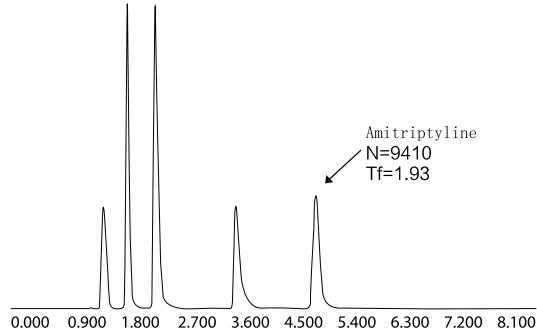

<b>Column:</b>	Xtimate® C18, 5 µm, 150x4.6 mm / Gemini C18, 5 µm, 150x4.6 mm
<b>Mobile Phase:</b>	A: 10mM Ammonium Bicarbonate pH 10.5 B: 90:10 Acetonitrile/buffer
<b>Gradient Program:</b>	0% to 100% B in 10min. 100% B for 7min. 0% B for 3min.
<b>Flow Rate:</b>	1.0 mL/min
<b>Temperature:</b>	50°C
<b>Detector:</b>	UV 254 nm
<b>Samples:</b>	1.Uracil      2.Methyl benzoate 3.Toluence    4.Naphthalene

### Unprecedented Peak Shape

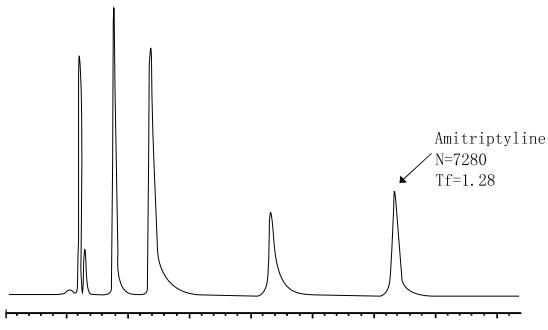

At mid pH, strong bases usually exhibit bad tailing due to secondary interactions between the analytes and the surface silaols. In Welch's unique technique, the hybrid layer totally covers the surface silanols and blocks analytes' access to these surface silanols. Improved bonding and endcapping further reduce silanol activity. As a result, hybrid particle based Xtimate® columns show unprecedented peak shape.

Besides C18 and C8 bonded phases, Xtimate also provides C4, CN, Phenyl bonded phases.

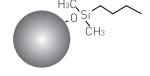

Xtimate® applies a new special Smoothpak™ technique to C18, C8, C4, CN, Phenyl and amino phases, different than the bonding method of other series. As a result, Xtimate® provides a different selectivity, improved stability and reproducibility. In particular, for the Phenyl phase of Phenyl-Hexyl, Xtimate® is totally different from Ultisil™ Phenyl. Xtimate® Phenyl phase's longer hexyl group provides extra hydrocarbon interaction and longer retention than conventional phenyl-propyl phase; it also provides better chemical stability.

Welch also adds polar embedded phase, Polar-RP on Xtimate® particles, to further improve peak shape for very polar and strong basic compounds and provides different selectivity than does C18 phase.

# Xtimate® Polymer Based Column

Xtimate® Sugar-H is a special column designed for Ribavirin. Packed with H<sup>+</sup> modified low-linking polystyrene-divinybenzene spheres (PS-DVB), this column can be applied for the analysis of organic acids and mixed alcohols.

Xtimate® Sugar-Ca is a strong cation exchange column packed with Ca<sup>2+</sup> modified PS-DVB resins; can be used for the analysis of sugar products.

Xtimate® PS/DVB is based on polystyrene-divinybenzene. This column can be used in extreme conditions (pH 1-14).

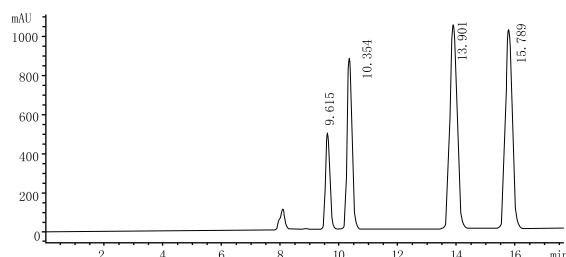

## Xtimate® Sugar-H

## Xtimate® SEC

Xtimate® SEC (size exclusion chromatography), also known as “global protein hydrophilic modified silica column”, is made from ultra-high purity, stable silica bonded with hydrophilic polymer and diol functional groups. This double bonding mechanism, which makes possible of nonspecific adsorption of high Mw polymers, proteins, biological enzymes, polypeptides and other biological samples, can be applied to separating water-soluble polymers from biomacromolecules.

- Ultra-high purity, stable silica bonded with hydrophilic polymer and diol functional groups.
- 5 µm or 3 µm silica microsphere, high separation efficiency
- 120 Å minibore columns fit for analysis of polar compounds such as cephalosporins; 300Å ones fit for biomacromolecules such as proteins and polypeptides.
- Five pore sizes: 120 Å, 300 Å, 500 Å, 700 Å and 1000 Å.

# Topsil® Series HPLC Column

Topsil® series HPLC column is a next-generation column by Welch, besides Ultisil™, Xtimate® and Welchrom®. This series use different silica and provide different selectivity.

## Features:

- High purity silica (99.99%) with 150 Å pore size and 260 m<sup>2</sup>/g surface area
  - 12% carbon loading for C18 phase
  - Because of large pore and moderate carbon loading, Topsil® C18 phase can also be used as AQ-C18 without phase collapse
  - Endcapped for excellent peak shape and lifetime
  - Lower back pressure than Ultisil™, almost the same column efficiency as Ultisil™
  - Good for small molecules and peptides
  - Topsil phases including C18, C8, Phenyl-Hexyl, Silica, NH<sub>2</sub> and CN

# Welchrom® Seires HPLC Column

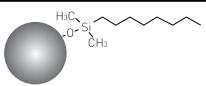

-- Combination of perfect peak shape and lowest back pressure

- Perfect peak shape and low back pressure
- Ultra-high purity(>99.999%) Type B silica particles
- New bonding and endcapping technique
- Economically priced

## Welchrom® C18

Structural Formula	
pH Range	1.5-10.0
Particle Size	5 µm
Surface Area(m <sup>2</sup> /g)	320(120 Å)
Carbon Loading(%)	19(120 Å)
USP List	L1
Endcapped	Yes

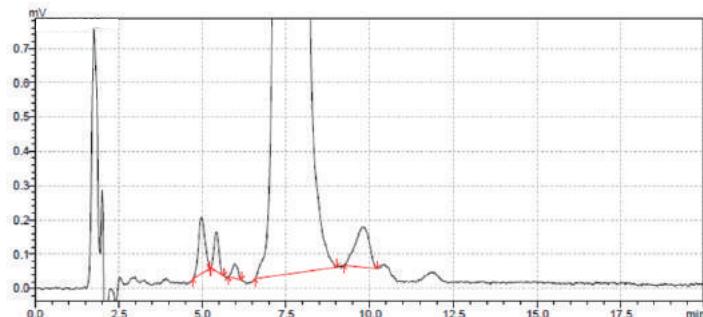

## Welchrom® C8

Structural Formula	
pH Range	1.5-10
Particle Size	5 µm
Surface Area(m <sup>2</sup> /g)	320(120 Å)
Carbon Loading(%)	12(120 Å)
USP List	L7
Endcapped	Yes

## Butenafine HCL

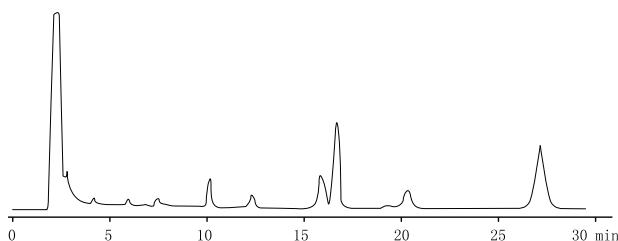

Column:	Welchrom® C18, 4.6x250 mm, 5 µm
Mobile Phase:	Acetate buffer/methanol/isopropanol=17/70/13
Flow Rate:	1.0 mL/min
Temperature:	Ambient
Detector:	282 nm
Injection Volume:	10 µL

## Pentoxyverine citrate

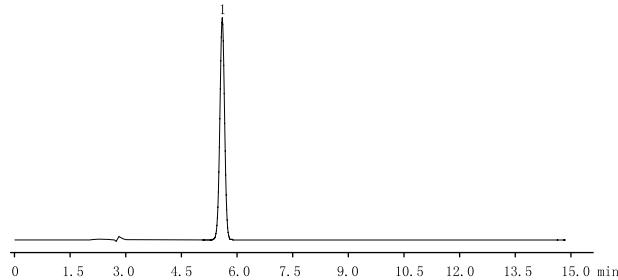

Column:	Welchrom® C18, 4.6x150 mm, 5 µm
Mobile Phase:	Water* /methanol=45/55 * Dilute 10 mL triethylamine to 1000 mL, adjust pH 3.0 with H <sub>3</sub> PO <sub>4</sub>
Flow Rate:	1.0 mL/min
Temperature:	30°C
Detector:	215 nm
Injection Volume:	20 µL

### Tanshinone IIA in *Salvia Miltiorrhiza*

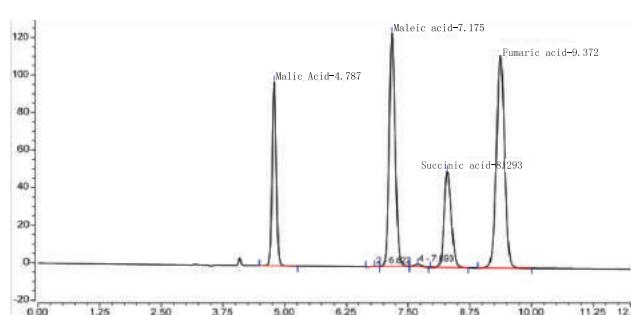

<b>Column:</b>	Welchchrom® C18, 4.6x250 mm, 5 µm
<b>Mobile Phase:</b>	Methanol/water=75/25
<b>Flow Rate:</b>	1.0 mL/min
<b>Temperature:</b>	22°C
<b>Detector:</b>	270 nm

### Imidacloprid

<b>Column:</b>	Welchchrom® C18, 250x4.6 mm, 5 µm
<b>Mobile Phase:</b>	Methanol/water=45/55
<b>Flow Rate:</b>	1.0 mL/min
<b>Temperature:</b>	25°C
<b>Detector:</b>	260 nm

### Malic acid

<b>Column:</b>	Welchchrom® C8, 4.6x250 mm , 5 µm
<b>Mobile Phase:</b>	Phosphoric acid/methanol/water=1/100/900
<b>Flow Rate:</b>	0.8 mL/min
<b>Temperature:</b>	20°C
<b>Detector:</b>	214nm
<b>Injection Volume:</b>	5 µL

# UHPLC Column

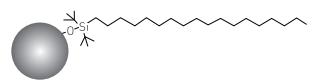

Welch also offers Ultisil™ UHPLC (1.8 µm) columns. With high column efficiency and good lot-to-lot reproducibility, Ultisil™ UHPLC can generate high quality data, decreasing the probability of repeated sample analyses while reducing the consumption of solvent at the same time. Ultisil™ UHPLC series offer a variety of bonded phases, specified guard columns and pre-columns for the users to design and realize faster and more environmentally friendly chromatography applications with higher resolution.

- Ultra Resolution: same resolution as or better than that of conventional column which has more packing materials
- Ultra speed: UHPLC offers more information per unit time and higher speed owing to its smaller particles.
- Sensitivity: higher N, narrower peak width (W), higher peak height. The system sensitivity of 1.8 µm UHPLC is 70% and 40% higher than that of conventional column of 5µm and 3.5µm packings, respectively.

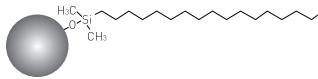

## Ultisil™ UHPLC XB-C18

## Hardware Features:

- Hardware Features:
- New design
  - Low dead volume
  - New special frit

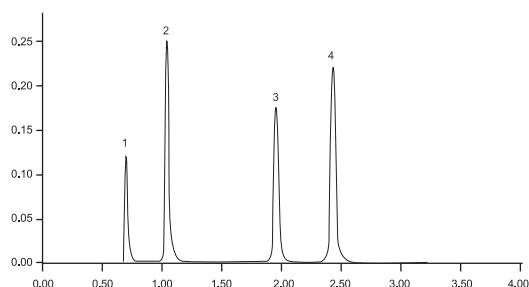

### Packing Materials Features:

- High efficiency 1.8 $\mu$ m particles
- High column efficiency and excellent strength
- Variety of bonding chemistries
- Stable column bed, highest pressure: 15000psi

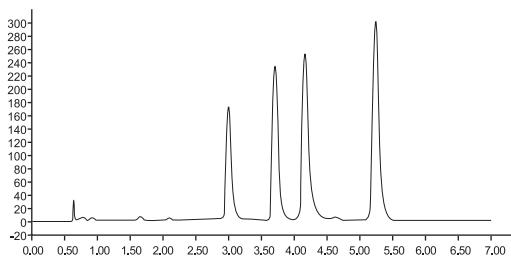

### Column Packing Features:

- Unique column packing technique
- Withstand ultra-high pressure of UHPLC instruments

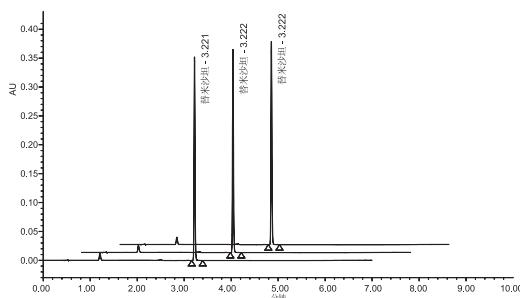

<b>Column:</b>	Ultisil™ UHPLC XB-C18, 2.1 ×100 mm, 1.8 $\mu$ m

# Boltimate™ Core-Shell HPLC Column

Welch Boltimate™ core-shell HPLC column particle size is 2.7  $\mu\text{m}$ , which consists of 1.7  $\mu\text{m}$  solid core and 0.5  $\mu\text{m}$  porous layer(porous shell).

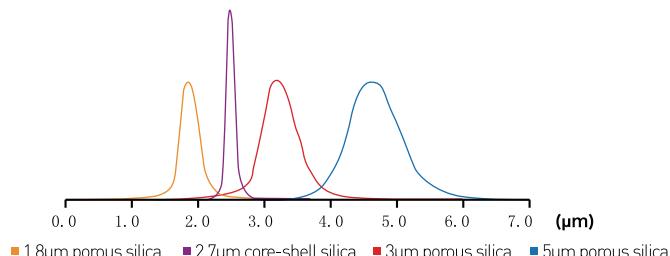

This kind of column can provide sub-2  $\mu\text{m}$  efficiencies (~200000 p/m) and high resolution at much lower back pressure. Boltimate core-shell column can be used on both HPLC and UHPLC system, and method optimization is also very easy.

## Features

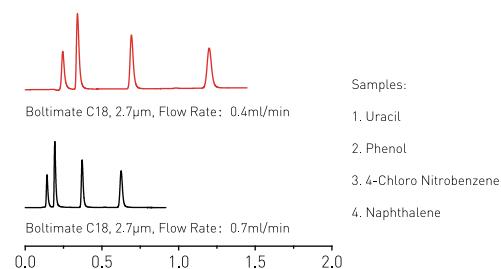

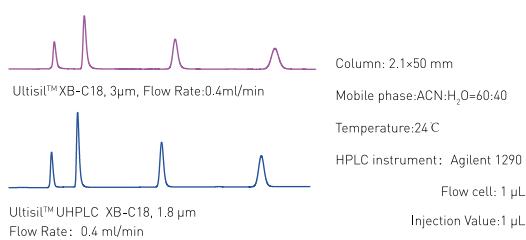

- Provide sub-2  $\mu\text{m}$  efficiencies (~200000 p/m) and ultra-high resolution at much lower back pressure
- Ultra fast separation
- Compatible with both HPLC and UHPLC system
- Narrow particle size distribution
- A standard 2  $\mu\text{m}$  inlet frit is used to resist plugging with dirty samples, suitable for complex sample
- A variety of bonding phases provide different selectivities, excellent peak shape and lot-to-lot reproducibility
- Maximum pressure: 600 bar

With the solid core and thin porous layer, the diffusion distance of sample molecular decreased, which means fast mobile phase flow rate can be used to increase the analytical speed. Compared with traditional porous HPLC columns, Boltimate core-shell column has the narrower particle size distribution, which provides higher column efficiency, higher resolution and lower back pressure.

	D10	D90	D90/D10
5 $\mu\text{m}$ porous silica	3.61	5.22	1.44
3 $\mu\text{m}$ porous silica	2.83	3.98	1.41
1.8 $\mu\text{m}$ porous silica	1.51	2.11	1.40
2.7 $\mu\text{m}$ Boltimate core-shell silica	2.51	2.81	1.12

Column	Theoretical plates	Column Pressure (bar)	Time
Ultisil™ XB-C18, 3 $\mu\text{m}$ , 2.1×50 mm	5600	85	2.0 min
Ultisil™ UHPLC XB-C18, 1.8 $\mu\text{m}$ , 2.1×50 mm	10500	260	1.8 min
Boltimate™ C18, 2.7 $\mu\text{m}$ , 2.1×50 mm	10100	108	1.5 min
Boltimate™ C18, 2.7 $\mu\text{m}$ , 2.1×50 mm	9500	190	0.8 min

Boltimate C18 column efficiency is almost the same with 1.8  $\mu\text{m}$  porous C18 column, and two times of 3  $\mu\text{m}$  porous C18 column. Even with 2X faster flow rate, the pressure of Boltimate is still lower than 1.8  $\mu\text{m}$  porous C18 column with the same column dimensions run under the same analysis conditions, without decreasing efficiency at the mean time.

## 1. Selection of Analysis Modes

### Selection 1

### Selection 2

## 2. Method Development Tool Kit for Pharmaceutical Industry

This kit consists of different columns with different bonding phases and selectivities. Please refer to details below for the application range. Besides columns, the tool kit also includes technical support from Welch technical team throughout the development of methods.

To develop a new method, purpose and requirements of the analysis shall first be confirmed, thus ideal parameters and results can be confirmed. First of all shall be the HPLC mode, which determined normally by following factors:

- Type and solubility of target compound
- Molecular weight of target compound
- Sample matrix
- Available stationary phases and columns

★ Please select the tool kit based on preliminary analysis of above tips.

## The "Universal" Kit

Column	Bonded phase	USP	Dimension	Description	Application range
Xtimate® C18	C18	L1	4.6 × 250mm, 5µm	Organic–inorganic hybridized surface; high chemical stability under high–content buffer salts conditions High pH tolerance (1.0–12.5); Double end–capped, high universality.	First choice for beginning; Great universality; Better peak shape.
Ultisil™ LP-C18	C18	L1	4.6 × 250mm, 5µm	Side chain steric protection to shield hydroxyl group; No end–capping (pH range 0.5–8.0); High steric hindrance selectivity; 100% water to 0% water and normal reagents applicable; Little loss on MS or ELSD under strong acid conditions.	First choice for mobile phase pH under 2; Strong orthogonality with Xtimate C18 column.
Ultisil™ XS-C18	C18	L1	4.6 × 250mm, 5µm	Unique high–density bonding, high carbon capacity, double end–capping; high steric hindrance selectivity, strong separation ability for mixture of planar solid structure; applies to separation of structural isomerism.	Strong orthogonality with normal C18 column; First choice for separating isomers.
Ultisil™ Polar-RP	C18	L1	4.6 × 250mm, 5µm	Polar group embedded in carbon chain of reversed–phase C18 stationary phase, brings good retention and peak symmetry for strong polar and alkaline substances; Embedded polar group enables hydrophilic stationary phase, with better retention of materials not retained on normal C18, and high tolerance to high water content mobile phase.	100% water tolerable; First choice for strong polar substances.
Ultisil™ XB-Phenyl	Phenyl	L11	4.6 × 250mm, 5µm	Classic reverse–phase bonding phase, provides better selectivity for benzene rings compared to linear alkane bonded phases.	Substance containing benzene rings.
Ultisil™ PFP	Phenyl	L11	4.6 × 250mm, 5µm	Fluorinated stationary phase, stronger ion exchange and polarity than alkyl stationary phase; Good selectivity for halogen–containing substances and structural isomers.	Separation of positional isomers on phenyl ring; Substance with halogen substituent.
Ultisil™ XB-NH <sub>2</sub>	NH <sub>2</sub>	L8	4.6 × 250mm, 5µm	First choice for sugar compounds	Polar compounds or sugar
Ultisil™ HILIC SiO <sub>2</sub>	SiO <sub>2</sub>	L3	4.6 × 250mm, 5µm	Most classic bonding phase in HILIC mode.	Strong polar compound
Ultisil™ UHPLC XB-C18	C18	L1	2.1 × 100mm, 1.8µm	Ultra high pressure LC, shortening retention time.	Fast separation under ultra high pressure.
Boltimate™ EXT-C18	C18	L1	3.0 × 100mm, 2.7µm	Low column pressure, high efficiency.	Fast separation in normal LC system

## Tool Kits for "Special Application"

### "High-Select & Universal" Kit

**Contains: Ultisil™ XB-C18, Ultisil™ LP-C18, Xtimate® C18**  
**Dimension: 4.6\*250mm, 5µm (other dimensions also available)**

- Applies to method screening, for general chromatographic analysis requirements;
- Suitable for strong polar compounds, acidic, neutral, alkaline substances.

### "Isomer Analysis" Kit

**Contains: Ultisil™ PFP, Ultisil™ PAH, Ultisil™ Hilic SiO<sub>2</sub>**  
**Dimension: 4.6\*250mm, 5µm (other dimensions also available)**

- Applies to isomer mixtures.
- Strong selectivity for ortho, para, meta isomers on indophenol ring and planar solid structure mixtures.

### "Bio-samples Analysis" Kit

**Contains: Ultisil™ LP-C18 (300Å), Ultisil™ XB-C4 (300Å), Ultisil™ XB-C8 (300Å)**  
**Dimension: 4.6\*250mm, 5µm (other dimensions also available)**

- Large pore size (300Å), suitable for macromolecules like proteins or peptides etc, providing better interaction with bonded phases;
- Various bonding phases with different retention, applies to retention and separation of proteins and peptides of various molecular sizes.

### "Extended Selectivity" Kit

**Contains: Ultisil™ Polar-RP, Ultisil™ ALK-C18, Ultisil™ XB-CN**  
**Dimension: 4.6\*250mm, 5µm (other dimensions also available)**

- Applies to method screening, for general chromatographic analysis requirements;
- Applies to strong polar or non-polar compounds and alkalines, with high water ratio conditions.

### "Hydrophilic Substance Analysis" Kit

**Contains: Ultisil™ AQ-C18, Ultisil™ Polar-RP, Ultisil™ LP-C18**  
**Dimension: 4.6\*250mm, 5µm (other dimensions also available)**

- Applies to strong polar substance without retention on normal C18, or separation of organic acid mixtures;
- Compatible with 100% – 0% water phase mobile phase.

Ultisil Cellu-D/Cellu-DR	5, 10 µm	2.0-9.0	N/A	320(120Å)	N/A
L43: Pentafluorophenyl groups chemically bonded to silica particles 5 to 10 µm in diameter.					
Ultisil PFP	3, 5 µm	1.5-10.0	13%(120Å)	320(120Å)	Yes
Boltimate EXT-PFP(Core-shell)	2.7 µm	1.5-12.0	5%(90Å)	120(90Å)	Yes
L51: Amylose tris-3,5-dimethylphenylcarbamate-coated, porous, spherical, silica particles, 5 to 10 µm in diameter.					
Ultisil Amy-D/Amy-DR	5, 10 µm	2.0-9.0	N/A	320(120Å)	N/A
L56: Propyl silane chemically bonded to totally porous silica particles, 3 to 10 µm in diameter.					
Ultisil LP-C3	5 µm	1.0-8.0	4%(120Å)	320(120Å)	No
L59: Packing having the capacity to separate proteins by molecular weight over the range of 5 to 7000 kDa. It is spherical (1.5-10 µm), silica-based, and processed to provide hydrophilic characteristics and pH stability.					
Xtimate SEC-120	3, 5 µm	2.0-7.5	N/A(120Å)	N/A	N/A
Xtimate SEC-300	3, 5 µm	2.0-7.5	N/A(300Å)	N/A	N/A
Xtimate SEC-500	5 µm	2.0-7.5	N/A(500Å)	N/A	N/A
Xtimate SEC-700	5 µm	2.0-7.5	N/A(700Å)	N/A	N/A
Xtimate SEC-1000	5 µm	2.0-7.5	N/A(1000Å)	N/A	N/A
L60: Spherical, porous silica gel, 10 µm or less in diameter, surface has been covalently modified with alkyl amide groups and endcapped.					
Ultisil Polar-RP	3, 5, 10 µm	1.5-10.0	18%(120Å)	320(120Å)	Yes
Xtimate Polar-RP	5 µm	1.0-12.5	16%(120Å)	320(120Å)	Yes
Ultisil UHPLC Polar-RP	1.8 µm	1.5-10.0	18%(120Å)	320(120Å)	Yes
L62: C30 silane bonded phase on a fully porous spherical silica, 3 to 15 µm in diameter.					
Ultisil XB-C30	3, 5, 10 µm	1.5-10.0	22%(120Å)	320(120Å)	Yes
L80: Cellulose tris(4-methylbenzoate)-coated, porous, spherical, silicaparticles, 5 µm in diameter.					
Ultisil Cellu-J/Cellu-JR	5, 10 µm	2.0-9.0	N/A	320(120Å)	N/A
Not Included in USP List					
Ultisil HILIC Amide	3, 5, 10 µm	2.0-8.0	7%(120Å)	320(120Å)	N/A
Ultisil HILIC Amphion II	5 µm	2.0-8.0	6%(120Å)	320(120Å)	N/A
Ultisil Amy-S/Amy-SR	5, 10 µm	2.0-9.0	N/A	320(120Å)	N/A
Ultisil MM NH <sub>2</sub> /CN	5 µm	2.0-8.0	N/A(120Å)	320(120Å)	N/A
Ultisil MM C18/SCX	5 µm	2.0-8.0	N/A(120Å)	320(120Å)	N/A

## 4. Cross Reference

### Ultisil XB-C18 can substitute:

Symmetry C18	Symmetry shield RP C18	
Luna C18	Luna C18(2)	Discovery C18
Hypersil BDS C18	Alltima C18	Zobax Eclipse C18
BetaBasic C18	Platinum EPS C18	Betasil C18
Inertsil ODS-2	Inertsil ODS-3	Supelcosil LC-18-DB
Kromasil 100A C18	HyPURITY C18	

### Ultisil AQ-C18 can substitute:

Aquasil C18	Atlantis C18	
Zorbax SB-AQ C18	Synergi Hydro-RP C18	
HydroBond PS C18	HydroBond AQ C18	
Ultra Aqueous C18	Prontosil C18 AQ	
YMC-Pack ODS-AQ	Elite Sino Chrom ODS-BP	

### Ultisil XB-C8 can substitute:

Symmetry C8	Luna C8	Luna C8(2)
Discovery C8	Hypersil BDS C8	Alltima C8
Zorbax Eclipse XDB C8	BetaBasic C8	Platinum EPS C8
Betasil C8	Inertsil C8	Inertsil C8-3
Supercosil LC-8-DB	Kromasil 100A C8	HyPURITY C8
YMC-Pack C8-AM	Adsorbosphere HS C8	Develosil C8
Cosmosil C8-MS	Nucleosil 100 C8 HD	

**Other Ultisil Columns: XB-CN, XB-Phenyl, XB-CN, SiO<sub>2</sub> and Polar RP can replace the most of the same type columns of other brands.**

### Xtimate® (wide pH range) can substitute:

Waters	Xterra series
	Xbridge series
Agilent	Extend series
Phenomenex	Gemini series

## Chiral Column Reference Table

Company	Brand	Coated Normal Phase				Coated Reversed Phase			
Welch	Ultisil	Cellu-D	Cellu-J	Amy-D	Amy-S	Cellu-D/R	Cellu-J/R	Amy-D/R	Amy-S/R
Daicel	Chiralcel	OD-H	OJ-H			OD-RH	OJ-RH		
	Chiralpak			AD-H	AS-H			AD-RH	AS-RH
